The Surface Fitting Problem

The Surface Fitting Problem

Given a mesh S_T in \mathbb{R}^3 , a positive integer k , and a positive real number ϵ , our goal here is to fit a C^k surface, S , in \mathbb{R}^3 to S_T .

The Surface Fitting Problem

Given a mesh S_T in \mathbb{R}^3 , a positive integer k , and a positive real number ϵ , our goal here is to fit a C^k surface, S , in \mathbb{R}^3 to S_T .

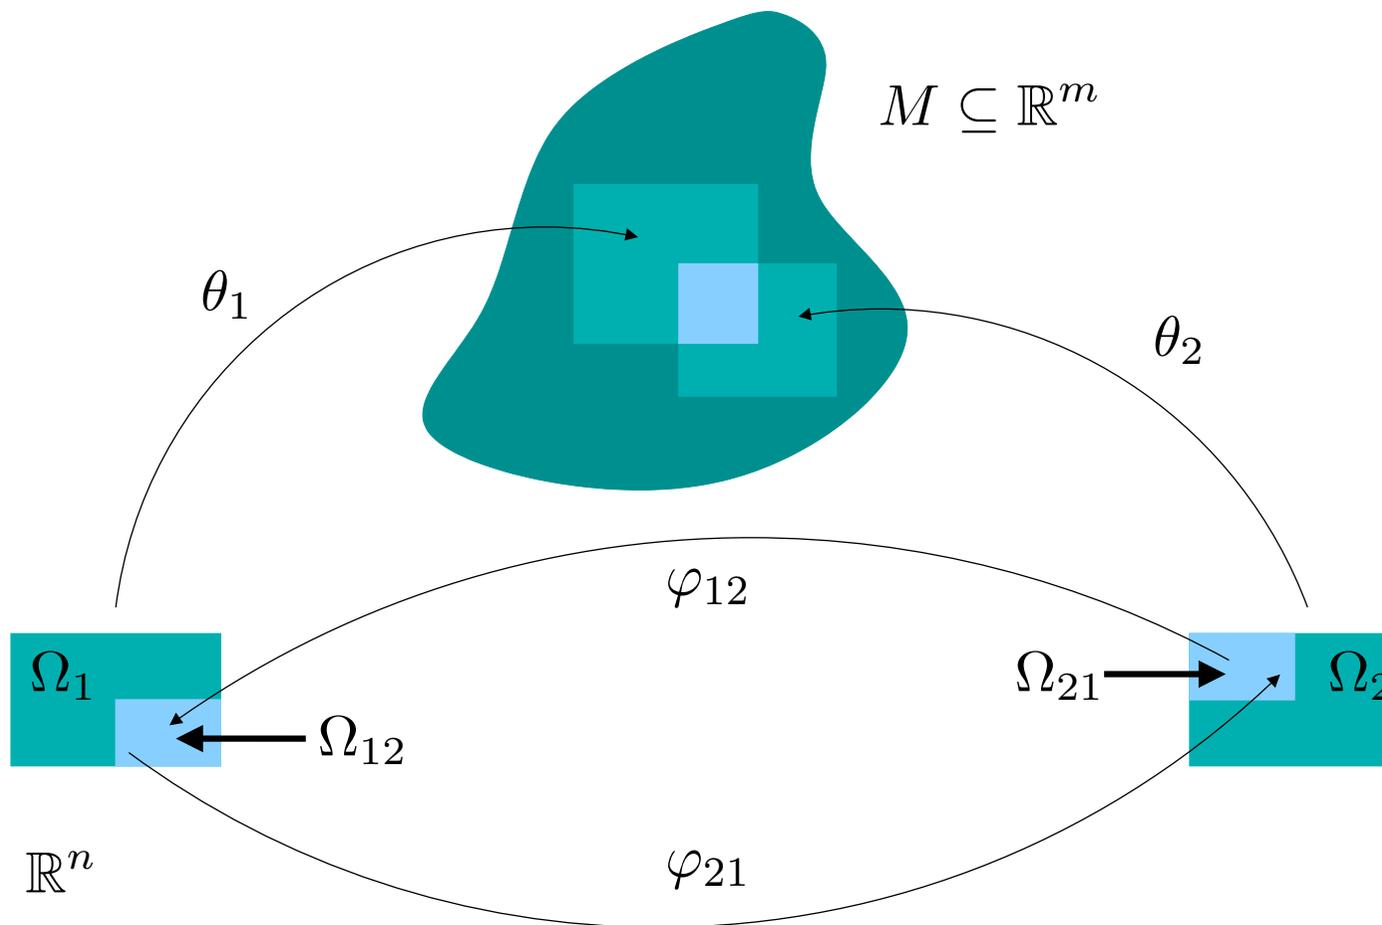

The Manifold-Based Approach:

We solve the fitting problem by defining a C^k parametric pseudo-surface, \mathcal{M} , such that S is the image, M , of \mathcal{M} in \mathbb{R}^3 .

$$\Omega_v = \{(x, y) \in \mathbb{R}^2 \mid (x - 2 \cdot l(v))^2 + y^2 < [\cos(\pi/m_v)]^2\},$$

where m_v is the degree of v .

\mathbb{R}^3

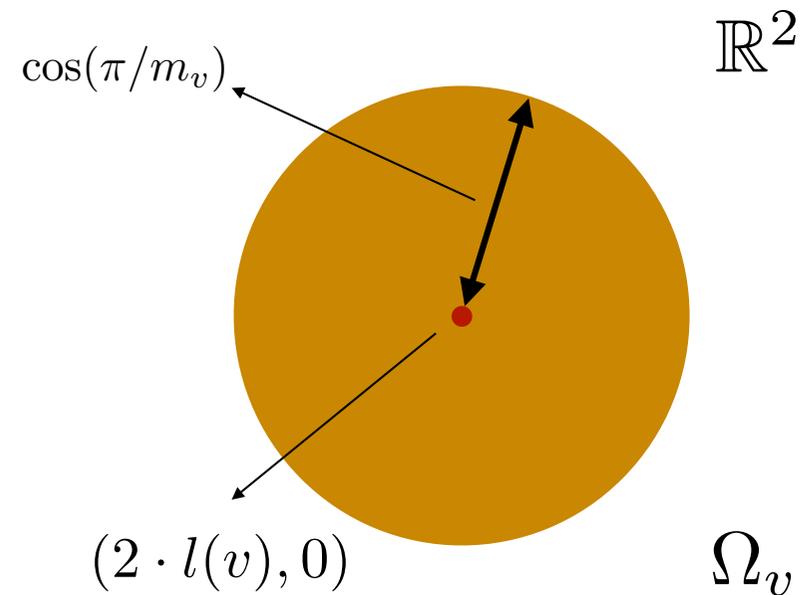

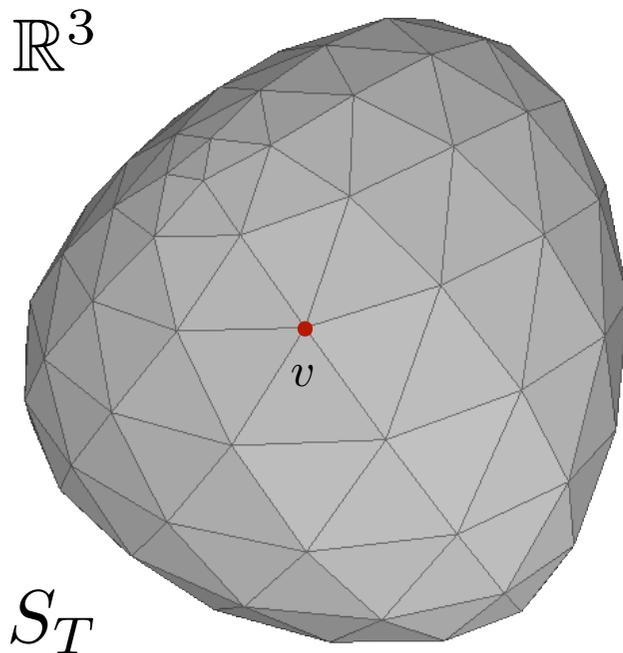

S_T

Building a Set of Gluing Data

For every v in I , the p -domain, Ω_v , is the point set

$$\Omega_v = \{(x, y) \in \mathbb{R}^2 \mid (x - 2 \cdot l(v))^2 + y^2 < [\cos(\pi/m_v)]^2\},$$

where m_v is the degree of v .

Building a Set of Gluing Data

Building a Set of Gluing Data

Remark:

It is important to mention that for every $v \in I$, the set Ω_v is open in \mathbb{R}^2 . Furthermore, for every $u, w \in I$, with $u \neq w$, we have

$$\Omega_u \cap \Omega_w = \emptyset.$$

So, the $(\Omega_v)_{v \in I}$ is a family of p -domains (see definition of sets of gluing data).

Building a Set of Gluing Data

Building a Set of Gluing Data

Gluing domains

Building a Set of Gluing Data

Gluing domains

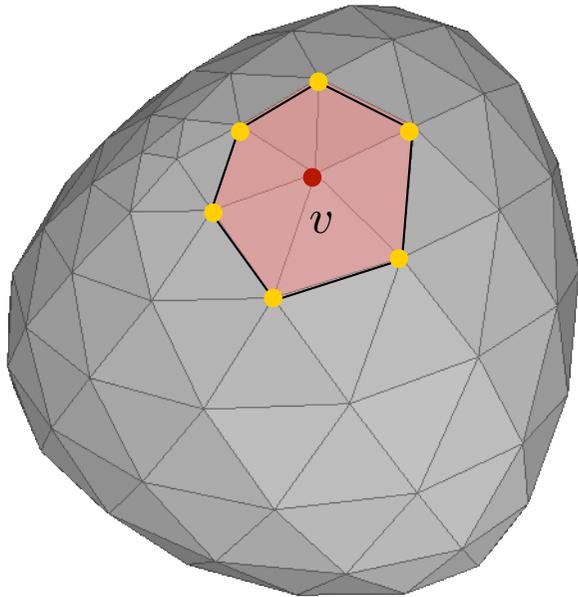

To define the family of gluing domains, $(\Omega_{ij})_{(i,j) \in I \times I}$, we need define the notions of a P-polygon and its associated triangulation, two linear functions, and a more general, transcendental map.

Building a Set of Gluing Data

Building a Set of Gluing Data

For each vertex v of S_T , we define a P -polygon, P_v :

Building a Set of Gluing Data

We can show that the above definition of transition functions satisfies conditions (3)(a)-(c) of the definition of sets of gluing data:

(a) $\varphi_{ii} = \text{id}_{\Omega_i}$, for all $i \in I$,

(b) $\varphi_{ij} = \varphi_{ji}^{-1}$, for all $(i, j) \in K$, and

(c) for all i, j , and k , if $\Omega_{ji} \cap \Omega_{jk} \neq \emptyset$ then $\varphi_{ji}^{-1}(\Omega_{ji} \cap \Omega_{jk}) \subseteq \Omega_{ik}$ and $\varphi_{ki}(x) = \varphi_{kj} \circ \varphi_{ji}(x)$, for all $x \in \varphi_{ji}^{-1}(\Omega_{ji} \cap \Omega_{jk})$.

Conclusions

Conclusions

We learned *one* way of defining a set of gluing data from a triangle mesh.

Conclusions

We learned *one* way of defining a set of gluing data from a triangle mesh.

The set of gluing data has n_v p -domains, and $2 \cdot n_e$ non-empty gluing domains and transition functions, where n_v and n_e are the number of vertices and edges, respectively, of the input triangle mesh.

Conclusions

We learned *one* way of defining a set of gluing data from a triangle mesh.

The set of gluing data has n_v p -domains, and $2 \cdot n_e$ non-empty gluing domains and transition functions, where n_v and n_e are the number of vertices and edges, respectively, of the input triangle mesh.

Our transition functions are C^∞ (which is a very desirable property), but they are not *very* simple (i.e., linear, affine, polynomial).

Conclusions

Conclusions

The complexity of a set of gluing data is basically determined by its “size” and by the complexity to evaluate the transition functions.

Conclusions

The complexity of a set of gluing data is basically determined by its “size” and by the complexity to evaluate the transition functions.

Ideally, we should have a *small* set of gluing data (space complexity) and *very simple* transition functions (time complexity).

Conclusions

The complexity of a set of gluing data is basically determined by its “size” and by the complexity to evaluate the transition functions.

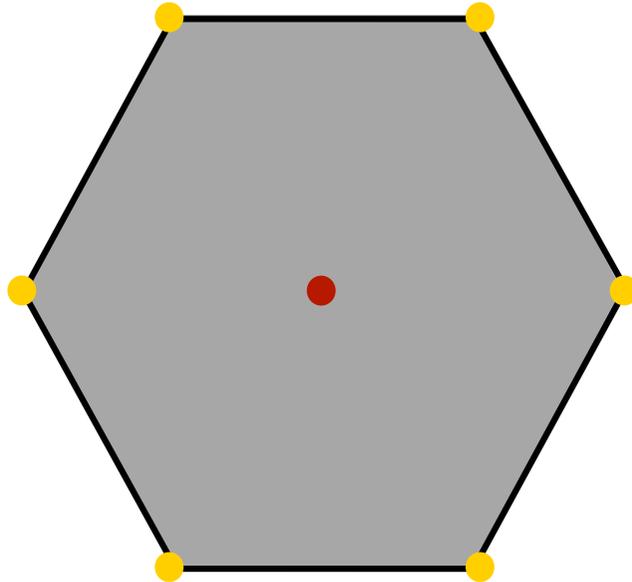

Ideally, we should have a *small* set of gluing data (space complexity) and *very simple* transition functions (time complexity).

What can we say about our construction?

Conclusions

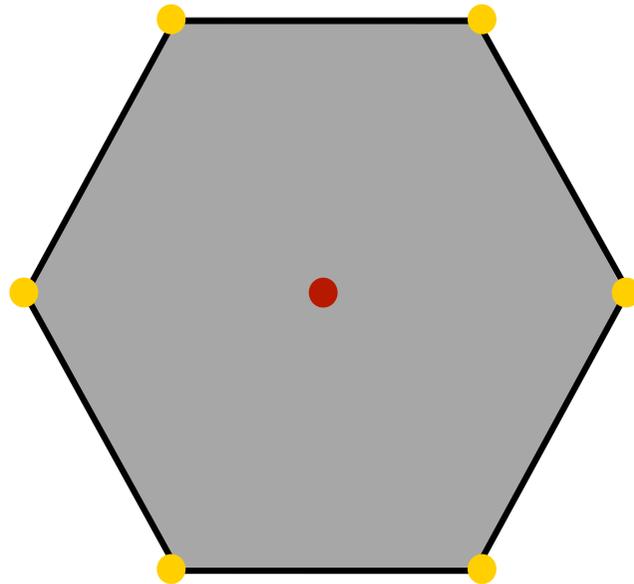

Conclusions

Why didn't we let the interior of the P -polygons be the p -domains?

Conclusions

Why didn't we let the interior of the P -polygons be the p -domains?

Simple answer: we failed to figure out the transition maps!

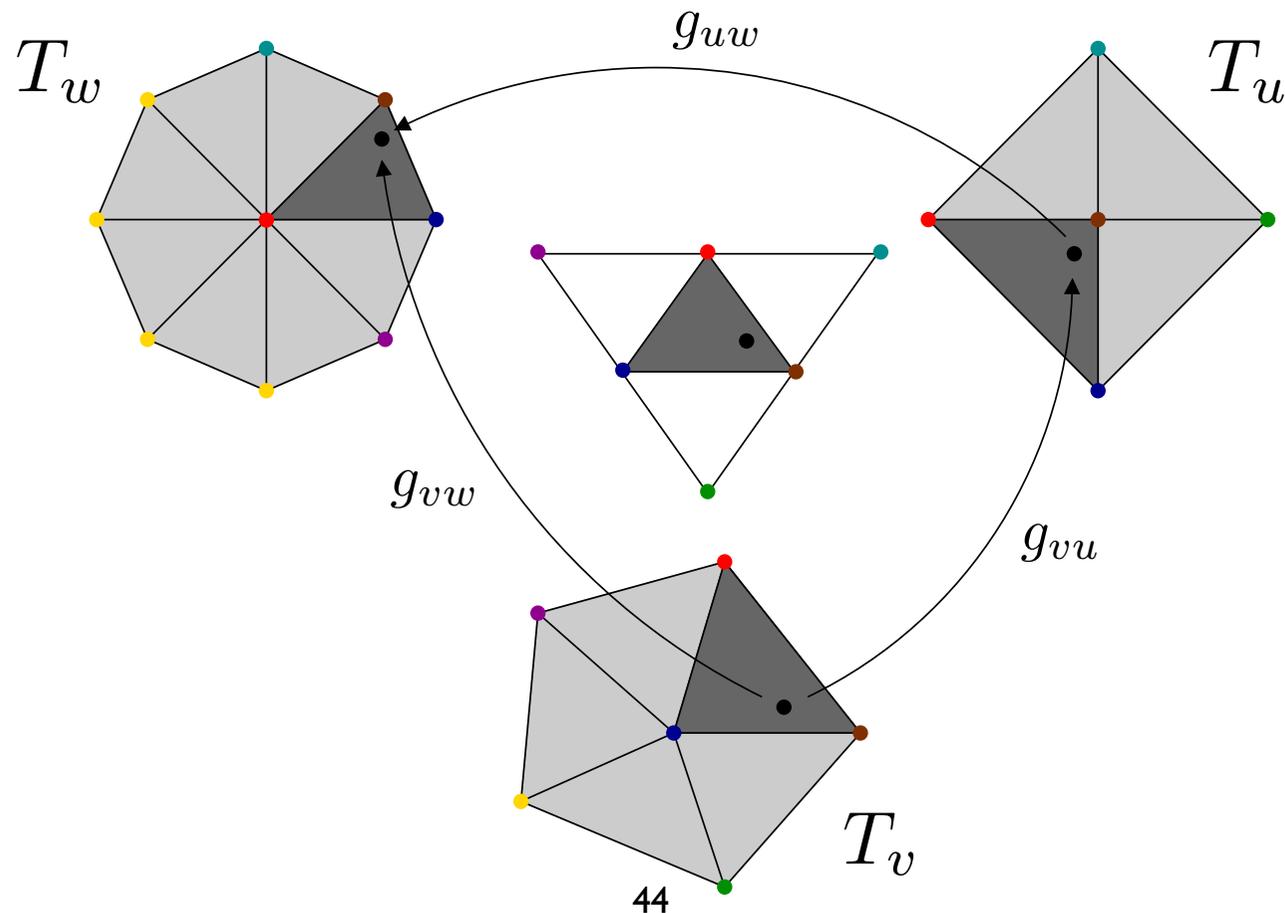

Conclusions

Conclusions

OPEN PROBLEM: Can you find a **simple** C^∞ bijective map g satisfying $g_{(v,w)} = g_{(u,w)} \circ g_{(v,u)}$ (this has to do with the cocycle condition)?

Conclusions

OPEN PROBLEM: Can you find a **simple** C^∞ bijective map g satisfying $g_{(v,w)} = g_{(u,w)} \circ g_{(v,u)}$ (this has to do with the cocycle condition)?
